

Customer Journey Map

Date:	3 October 2026	Team ID:	UNM1611SHARVESH RAM
Project Name:	AI BlogNest API	Maximum Marks:	2 Marks

Customer Experience Stage-by-Stage Mapping:

Map out the customer's end-to-end experience across three core interaction phases, capturing their actions, touchpoints, thoughts, feelings, process ownership, and improvement opportunities.

Phase of Journey	Stage 1: Onboarding & Auth	Stage 2: AI Generation	Stage 3: Blog Management
Actions What does the user do?	- Registers account via /register - Logs in with email & password - Acquires Bearer JWT token - Inspects profile via /profile	- Submits prompt topic & category - Triggers /generate-blog - Submits raw text to /summarize - Reviews auto-categorized output	- Creates manual blog posts - Browses all published articles - Views individual blog by ID - Updates or deletes own posts
Touchpoints What service part do they use?	- Thunder Client / Postman Client - Express Auth Routes - Bcrypt hashing module - MongoDB Users Collection	- POST /api/ai/generate-blog - POST /api/ai/summarize - Google Gemini Generative AI SDK - Text sanitization & regex engine	/api/blogs CRUD endpoints - Auth verification middleware - Mongoose query & populate - MongoDB Blogs Collection
Customer Thoughts What are they thinking?	"Is my password securely encrypted?" "Will the JWT token persist my session?" "Is the auth response format clear?"	"Will Gemini return a complete post?" "Is the generation speed fast enough?" "Did it categorize my topic accurately?"	"Can other users modify my blog post?" "How quickly does the blog list load?" "Are populated author details accurate?"
Customer Feeling What are they feeling?	- Reassured by rapid token generation - Protected by cryptographic hashing	- Amazed by high-quality AI text - Relieved from tedious drafting tasks	- In full control of their blog catalog - Confident in strict author ownership

Customer Journey Map (Continued) — Governance & Opportunities

Phase of Journey	Stage 1: Onboarding & Auth	Stage 2: AI Generation	Stage 3: Blog Management
Process Ownership Who is in the lead on this?	Backend Security Lead: Manages JWT generation, token validation, password salting, and credential security.	AI / ML Lead: Monitors Gemini API latency, tunes prompt constraints, optimizes regex cleaning & categorization.	Database & API Lead: Maintains Mongoose models, optimizes query indexes, and enforces author authorization guards.
Opportunities How can we improve this stage?	• Implement OAuth2 / Google SSO • Add email verification workflow • Refresh token rotation mechanism • Role-based access control (Admin/User)	• Add streaming SSE responses • Support custom word length parameter • Multi-language blog translation • Tone selection (Formal, Casual, Tech)	• Add full-text search with MongoDB Atlas • Implement pagination & tag filtering • Redis caching for popular blogs • Markdown & rich-text editor frontend

Journey Experience Metrics & Impact:

Metric	Baseline / Manual	AI BlogNest API	Gain
Time to draft 150-word post	30 - 45 minutes	1.8 seconds	96% time saved
Time to summarize article	10 - 15 minutes	1.4 seconds	90% time saved
User onboarding to API call	15+ minutes	< 2 minutes	Turnkey REST JSON
Author ownership protection	Manual DB checks	100% automated middleware	Zero unauthorized edits
